

Computer gurus need to know about software licensing

For all the computer savvy college graduates and undergraduates who are preparing to take the technological world by storm, there is a distinct need for education in software license. Many of these eager young ingenues will proceed to create their own programs with little care for their licensing and copywriting issues until the project either gets off the ground or its too late.

Software license is really another way to phrase software copyright. A software license, in essence, is a way of contracting with those who distribute or use your created software, and a software license also protects from the damaging effects of software theft and spamming. Many times, a software license can also protect against shared software, or free software, which is readily available for public download online, though there is a specific type of software license that can be applied to those categories as well.

A software license is the smartest way to protect your invested time, money, creative work and future financial stability. There are several different sub categories within the broader category of software license. These include proprietary, free and open source software, the latter two being largely public download and sharing categories. While these are available with a software license intact, the more popular choice is proprietary license.

Software license works very closely with copyright laws to protect the owner and creator of the software from being abused by the end user. For those studying any sort of computer programming in college or university, a course on [software licensing](#) and copyright law should most definitely be required to enhance the user knowledge and experience.

This, in turn, will benefit the public as it will limit the number of violations for software downloads and pirating of information. It will also benefit the creators and distributors of the software because they will be more fully able to gain from their hard work and investment.
